

# hw4 exchange system test procedure

Test procedure(not using docker):

First we should use

**make**

to compile the program, then we run

**taskset -c 0 ./serv (for 1 cpu test)**

**taskset -c 0-1 ./serv (for 2 cpu test)**

**taskset -c 0-3 ./serv (for 4 cpu test)**

**on the host machine**

Then we run

**./test.sh**

on the client machine to generate concurrent 100 clients, each sending 1000 requests

Then we immediately switch back to the host machine and run

**./postg.sh (before running it we should change the value of parameter 'c' in the bash file )**

Then we can get the result from client side
